Solving Linear Programming Problems. Now, we have all the steps that we need for solving linear programming problems, which are: Step 1: Interpret the given situations or constraints into inequalities. Step 2: Plot the inequalities graphically and identify the feasible region. Step 3: Determine the gradient for the line representing the solution (the linear objective function).

Linear Programming (solutions, examples, videos)

This is a problem from a current assignment using the process called linear programming. First you define the variables. Next, determine the objective function. Third, write the inequalities. Fourth, graph the inequalities and determine the feasible region. Next, determine the coordinates of the vertices.
