An experiment that involves potatoes, water, and salt are conducted to prove that there's an osmosis reaction in a plant cell, which is in this case it's a potato. Osmosis is a process where there's a movement of molecules in dissolve component such as water from a high concentration to a lower concentration with a membrane selective permeable.

OSMOSIS EXPERIMENT: POTATO, WATER, SALT

Osmosis is the chemical process of diffusion, involving the transfer of solvent with a lower concentration of a certain solute through a semipermeable membrane, and into the area containing a higher concentration of that solute. It sounds like a confusing concept to teach younger children just getting into the sciences, but it's actually quite simple, and can be demonstrated with only a potato, some water, and a little bit of salt.

METHOD. Peel the potato. Accurately cut 4 cubes of potato that measure 2 x 2 x 2cm. Weigh all potato cubes individually and record data. Place 50 ml distilled water in a beaker. Place the 2 potato cubes in the distilled water. Leave for 20 minutes. Use a spoon to carefully remove the 2 potato cubes ...

Potato (Osmosis) Experiment - AJ x Biolit

The shrinking and expanding of the potato strips is due to osmosis. Potatoes are made of cells, and their cell walls act as semipermeable membranes. The 0 grams solution contains less salts and...

Make a Potato Shrink--with Saltwater - Scientific American

If you put a piece of potato into pure water, the water concentration is obviously higher outside the potato. Therefore water moves into the potato by osmosis. This will cause the potato piece to swell. However, if you put a piece of potato into a strong salt solution (where the water concentration is low), then water will move out of the potato.

How does the concentration of salt solution affect osmosis ...

Osmosis is one of the many forms of Passive transport, meaning it requires no energy (Adenosine triphosphate) to happen. In this lab experiment, we will use different sucrose concentration solutions (0.0, 0.2, 0.4, 0.6, 0.8, 1.0 mol/dm³) and compare it will distilled water solution as well to see how each solution affects the size of the potato and how high the diffusion of osmosis in each solute concentration will be in comparison to one another.

Therefore for osmosis to occur, the two solutions must be separated by a semi-permeable, membrane, for this case, the potato cell membrane is only permeable to water molecules from

The Osmosis of Potato Strips - GRIN

Overnight, several things happened to the potato slices. The potatoes in the solutions of 10%, 5%, and 1% seawater all shrunk, while the potato in the freshwater grew in length. Concerning mass, the potatoes in the solutions of 5%, 1% and pure water all gained mass, while the potato in the 10% saltwater solution lost mass.

In other words, the dissolvent gets into the solution under the influence of so-called osmosis pressure. As soon as the hydrostatic pressure equals the osmosis pressure, the process ends. So, in the first can with the little amount of salt the concentration of the latter was equal both in potato cells and the environment.
