In Identifying Outliers and Missing Data we show how to identify missing data using a supplemental data analysis tool provided in the Real Statistics Resource Pack. A simple approach for dealing with missing data is to throw out all the data for any sample missing one or more data elements.

Dealing with Missing Data | Real Statistics Using Excel

• Missing data (and the observed data) can be considered a simple random sample of the complete data. • Missing at Random (MAR) • The propensity for a data point to be missing is not related to the missing data, but it is related to observed data.

Dealing with Missing Data in Your Research

This is a common statistical approach to the analysis of longitudinal repeated measures data where some follow-up observations may be missing. Longitudinal data track the same sample at different points in time. Both these methods can introduce bias in analysis and perform poorly when data has a visible trend
